### DR – 压力控制 Pressure control

在泵的控制范围内，恒定控制将液压系统中的压力保持恒定。因此，泵只提供执行器所需的液压油量。压力可在控制阀中无级设定。  
In the control range of the pump, the pressure in the hydraulic system is kept constant. Therefore, the pump only provides the hydraulic oil required for the actuator. Pressure can be set in the control valve.

#### 静态特性曲线

( $n_1=1500\text{ rpm}$ ;  $t_{oil}=50^\circ\text{C}$  时)

#### 动态特性曲线

左侧曲线显示了测试条件下的平均没量值。

条件:  $n=1500\text{ rpm}$ ;  $t_{oil}=50^\circ\text{C}$

管路主溢流阀设在 350bar

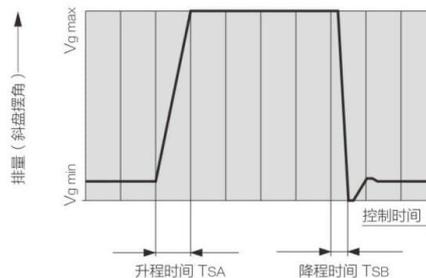

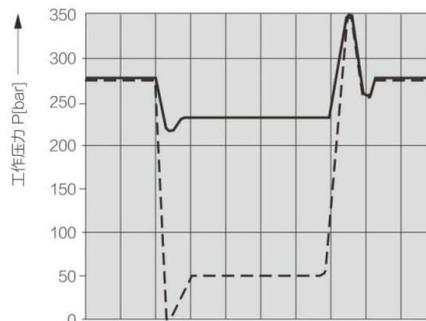

使用距离泵压力出油口下游1m的溢流阀，迅速开启或关闭压力管路，可实现分级负载。

Left curve shows the average value of the test conditions.

Condition:  $n=1500\text{ rpm}$ ;  $t_{oil}=50^\circ\text{C}$

The main overflow valve is located in 350bar

Using the distance pump pressure from the oil port downstream 1m of the overflow valve, quickly open or close the pressure line, can achieve the classification load.

### DFR/DFR1 – 压力/流量控制 Pressure / flow control

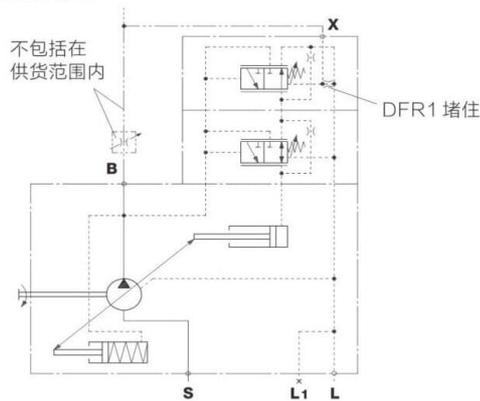

除了压力控制功能之外，还可通过压差（如节流孔或换向阀上的压差）调节泵流向执行元件的流量。泵只提供执行器所需的油液。在DFR1型上，油口X与油箱之间的节流孔被堵住。压力控制的功能和内容参见第18/19页。

In addition to the pressure control function, but also through the differential pressure (such as the throttle valve or valve on the pressure difference) to regulate the flow of the pump flow. Pump to provide the oil needed for the actuator. In the DFR1 type, the throttle hole between the oil port X and the fuel tank is blocked. The function and content of the pressure control refer to page 18/19.

### DFLR – 压力/流量/功率控制 Pressure / flow / power control

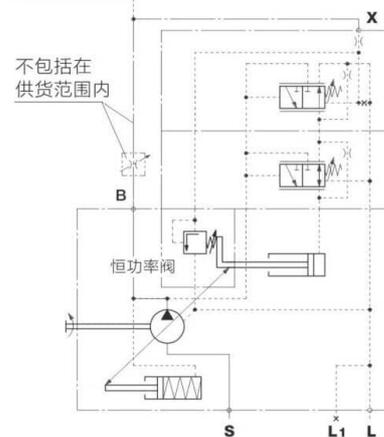

为了在工作压力变化的情况下获取恒定的驱动扭矩，通过改变轴向柱塞元件的摆角，从而改变输出流量，使流量和压力的乘积保持恒定。流量控制只能在恒功率控制曲线以下。

In order to obtain a constant driving torque in the case of working pressure change, by changing the angle of the axial piston element, thus changing the output flow, so that the product of flow and pressure remain constant. Flow control can only be in the constant power control curve.
